What is Claimed Is:

1. A catheter system comprising:

an elongated, flexible, hollow outer tubular member having a distal end and a proximal end;

an elongated, flexible, inner tubular member having a distal end and a proximal end;

said inner tubular member disposed within said outer tubular member such that a fluid channel having a fluid channel length is defined between the inner and outer tubular members;

a stent mounting location located near said distal ends of said inner and outer tubular members;

at least one spacer disposed within said fluid channel between said inner tubular member and said outer tubular member for maintaining a spacing between said inner tubular member and said outer tubular member, said spacer longitudinally traversing at least 10 percent of said fluid channel length; and an admission port in fluid communication with said fluid channel.

- 2. The catheter system according to claim 1, wherein said spacer is a longitudinal spacer extending a majority of a length from said proximal end to said distal end of said inner and outer tubular members.
- 3. The catheter system according to claim 1, wherein said spacer is a continuous longitudinal extension traversing a majority of a length from said proximal end to said distal end of said inner and outer tubular members.
- 4. The catheter system according to claim 1, wherein said spacer traverses at least 25 percent of said fluid channel length.

- 5. The catheter system according to claim 1, wherein said spacer traverses at least 50 percent of said fluid channel length.
- 6. The catheter system according to claim 1, wherein said spacer traverses at least 75 percent of said fluid channel length.
- 7. The catheter system according to claim 1, wherein said spacer traverses a majority of said fluid channel length.
- 8. The catheter system according to claim 1, wherein said spacer is disposed to centrally position said inner tubular member within said outer tubular member.
- 9. The catheter system according to claim 1, wherein said spacer is disposed to maintain said inner tubular member in an offset position within said outer tubular member.
- 10. The catheter system according to claim 1, wherein said spacer is a spline elongated in a direction along a length of the catheter system.
- 11. The catheter system according to claim 10, wherein said catheter system includes a plurality of splines elongated along the length of the catheter system.
- 12. The catheter system according to claim 11, wherein said splines couple to said outer tubular member and project inwardly towards said inner tubular member.
- 13. The catheter system according to claim 11, wherein said splines couple to said inner tubular member and project outwardly towards said outer tubular member.

- 14. The catheter system according to claim 1, wherein said spacer includes a plurality of radial, spaced-apart spacer members that extend longitudinally along said fluid channel.
- 15. The catheter system according to claim 1, wherein said spacer comprises at least one helical spacer extending along a length of said fluid channel.
- 16. The catheter system according to claim 15, wherein said helical spacer is coupled to said inner tubular member and projects radially outward from said inner tubular member.
- 17. The catheter system according to claim 1, wherein said spacer includes at least one thermal bonding surface to fixedly couple said inner tubular member and said outer tubular member.
- 18. The catheter system according to claim 17, wherein said bonding surface is located adjacent the distal end of said outer tubular member.
- 19. The catheter system according to claim 1, wherein said inner tubular member is hollow to track over a guide wire.
- 20. The catheter system according to claim 1, including a discharge opening in fluid communication with said fluid channel, the discharge opening being located near said distal end of said outer tubular member.
- 21. The catheter system according to claim 20, wherein said discharge opening is formed in said outer tubular member to permit fluid flow from said fluid channel to a patient's lumen.

- The catheter system according to claim 1, wherein said stent mounting location comprises a balloon arrangement for balloon stent delivery, said balloon arrangement being in fluid communication with said fluid channel.
- The catheter system according to claim 1, wherein said stent mounting location 23. comprises a self-expanding stent arrangement for self-expanding stent delivery, said stent being exposed by axially retracting said outer tubular member relative to said inner tubular member.
- 24. A balloon catheter system, comprising:

an elongated, flexible, hollow outer tubular member having a distal end and a proximal end;

an elongated, flexible, inner tubular member having a distal end and a proximal end;

said inner tubular member disposed within said outer tubular member such that a fluid channel having a fluid channel length is defined between the inner and outer tubular members;

at least one spacer disposed within said fluid channel between said inner tubular member and said outer tubular member for maintaining a spacing between said inner tubular member and said outer tubular member, said spacer longitudinally traversing at least 10 percent of said fluid channel length;

an admission port in fluid communication with said fluid channel; and an expandable balloon arrangement located near said distal ends of said inner and outer tubular members, said expandable balloon arrangement being in fluid communication with said fluid channel.

A stent delivery system, comprising: 25.

> an outer tubular member having a distal end and a proximal end; an inner tubular member having a distal end and a proximal end;

Attor Oocket No.: 11576.51USI1

said inner tubular member disposed within said outer tubular member defining a passageway therebetween;

a stent positioned proximate said distal end of said inner tube; an admission port in fluid communication with said passageway; and at least one fluid exchange aperture adjacent said distal end of said outer tubular member to deliver a media from said passageway to a patient's body lumen, the fluid exchange aperture being located distal to a longitudinal mid-point of the stent.

- 26. The stent delivery system of claim 25, wherein the fluid exchange aperture extends radially through the outer tubular member.
- 27. The stent delivery system of claim 25, wherein the stent delivery systems includes a plurality of fluid exchange apertures, including at least a first fluid exchange aperture and a second fluid exchange aperture, said first and second fluid exchange apertures being positioned adjacent to opposite ends of said stent.
- 28. The stent delivery system of claim 25, wherein the stent is a self-expanding stent.
- 29. The stent delivery system of claim 28, wherein the self-expanding stent is exposed by slidably retracting said outer tubular member relative to said inner tubular member.
- 30. The stent delivery system of claim 25, further including a pressure measuring device for measuring fluid pressure within the passageway.
- 31. The stent delivery system of claim 25, wherein the outer tubular member includes a sheath portion for covering the stent, and wherein the sheath portion defines at least one fluid exchange aperture.

Att Docket No.: 11576.51USI1

32. A stent delivery system, comprising:

- (a) a stent;
- (b) a catheter including a stent mounting location at which the stent is mounted:
 - (i) the catheter further including a retractable sheath for covering the stent;
 - (ii) the catheter defining a fluid exchange passageway, the fluid exchange passageway including a fluid exchange openings that opens to an exterior of the catheter, the fluid exchange openings being located near proximal and distal ends of the stent mounting location.
